Examples

examples here...

discount.rate.vector

Vectorize the Discount Rate

Description

Generate a vector with discount rate to be applied to each of the time periods.

Usage

```
discount.rate.vector(interest.rate, number.of.periods,
  begin.of.period = FALSE)
```

Arguments

interest.rate A number that represents the nominal Interest Rate, presented by year.

number.of.periods

Times that interest rate should be applied.

begin.of.period

A boolean that represents if the Tax Rate will be applied at the beginning of period. FALSE by default.

See Also

Other financial: [draw.cfs](#), [future.value](#), [inflation.free.interest.rate](#), [present.value](#)

Examples

```
ex.disc.vector <- discount.rate.vector(6.19, 12)
```

draw.cfs	<i>Draw the graph of cash flow.</i>
----------	-------------------------------------

Description

Draw the graph of cash flow.

Usage

```
draw.cfs(cfs, gt = "Cash Flow Graphic")
```

Arguments

cfs	A vector with a series of cash flows.
gt	A title for the graph.

See Also

Other financial: [discount.rate.vector](#), [future.value](#), [inflation.free.interest.rate](#), [present.value](#)

Examples

```
ex.cfs <- c(-2000,1000,1500,-500,500)
draw.cfs(ex.cfs, 'My Cash Flow')
```

future.value	<i>Calculate the future value of an asset at a specific date. It measures the nominal future sum of money that a given sum of money is "worth" at a specified time in the future assuming a certain interest rate, or more generally, rate of return.</i>
--------------	-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Description

Calculate the future value of an asset at a specific date. It measures the nominal future sum of money that a given sum of money is "worth" at a specified time in the future assuming a certain interest rate, or more generally, rate of return.

Usage

```
future.value(present.value, interest.rate, number.of.periods)
```

Arguments

`present.value` A number that represents the present value of the money.
`interest.rate` A number that represents the interest rate.
`number.of.periods`
A number that represent the number of periods.

See Also

Other financial: [discount.rate.vector](#), [draw.cfs](#), [inflation.free.interest.rate](#), [present.value](#)

Examples

```
ex.fv <- future.value(1000, 1.1425, 12)
print(ex.fv)
```

`inflation.free.interest.rate`

Calculate the Inflation-free Interest Rate.

Description

Calculate the Inflation-free Interest Rate.

Usage

```
inflation.free.interest.rate(interest.rate = 14.25, inflation.rate = 7.59)
```

Arguments

`interest.rate` A number that represents the nominal Interest Rate, presented by year.
`inflation.rate` A number that represents the Inflation Rate, presented by year.

See Also

Other financial: [discount.rate.vector](#), [draw.cfs](#), [future.value](#), [present.value](#)

Examples

```
ex.ifir <- inflation.free.interest.rate(14.25, 12)
```

nfv	~~function to do ... ~~
-----	-------------------------

Description

~~ A concise (1-5 lines) description of what the function does. ~~

Usage

```
nfv(cfs, r, bop = TRUE)
```

Arguments

cfs	~~Describe cfs here~~
r	~~Describe r here~~
bop	~~Describe bop here~~

Details

~~ If necessary, more details than the description above ~~

Value

~Describe the value returned If it is a LIST, use

comp1	Description of 'comp1'
comp2	Description of 'comp2'

Note

~~further notes~~

Examples

```
##---- Should be DIRECTLY executable !! ----
##-- ==> Define data, use random,
##--or do help(data=index) for the standard data sets.

## The function is currently defined as
function (cfs, r, bop = TRUE)
{
  e <- if (bop) {
    0:(length(cfs) - 1)
  }
  else {
    1:(length(cfs))
  }
  tax <- (1 + (r/100))^e
  return(cfs * tax)
}
```

npv	<i>~~function to do ... ~~</i>
-----	--------------------------------

Description

~~ A concise (1-5 lines) description of what the function does. ~~

Usage

```
npv(cfs, r, bop = TRUE)
```

Arguments

cfs	~~Describe cfs here~~
r	~~Describe r here~~
bop	~~Describe bop here~~

Details

~~ If necessary, more details than the description above ~~

Value

~Describe the value returned If it is a LIST, use

comp1	Description of 'comp1'
comp2	Description of 'comp2'

Note

~~further notes~~

## The function is currently defined as
function (cfs, r, bop = TRUE)
{
  e <- if (bop) {
    0:(length(cfs) - 1)
  }
  else {
    1:(length(cfs))
  }
  tax <- (1/((1 + (r/100))^e))
  return(cfs * tax)
}
```

present.value

Calculate the present value of an asset at a specific date.

Description

In economics, present value, also known as present discounted value, is the value of an expected income stream determined as of the date of valuation. The present value is always less than or equal to the future value because money has interest-earning potential, a characteristic referred to as the time value of money, except during times of negative interest rates, when the present value will be less than the future value.

Usage

```
present.value(future.value, interest.rate, number.of.periods)
```

Arguments

future.value A number that represents the future value of the money.
interest.rate A number that represents the interest rate.
number.of.periods A number that represent the number of periods.
