

# Package ‘ifm’

May 22, 2016

**Type** Package

**Title** Set of functions for financial evaluation of Software Projects

**Version** 1.0

**Date** 2016-04-20

**Author** Eber Schmitz

**Maintainer** Alexandre Costa <afcosta@br.ibm.com> and  
Antoanne Pontes <antoanne@ufrj.br> and  
Eduardo Chiote <eduardochiote@gmail.com>

**Description** R package with a set of functions for financial evaluation of  
Software Project.

**License** LGPL (>= 2.1)

**URL** <https://github.com/afcosta-ibm/ifm>

**BugReports** <https://github.com/afcosta-ibm/ifm/issues>

**NeedsCompilation** no

**RoxygenNote** 5.0.1

**Imports** igraph, XLConnect

ifm-package	<i>Set of functions for financial evaluation of Software Projects</i>
-------------	---

---

**Description**

R package with a set of functions for financial evaluation of Software Project.

**Details**

The DESCRIPTION file: This package was not yet installed at build time.

Index: This package was not yet installed at build time.  
~~ An overview of how to use the package, including the most important functions ~~

**Author(s)**

Eber Schmitz  
Maintainer: Alexandre Costa <afcosta@br.ibm.com> and Antoanne Pontes <antoanne@ufrj.br>  
and Eduardo Chiote <eduardochiote@gmail.com>

**Examples**

## examples here...

---

cpm	<i>The critical path method (CPM) is a step-by-step project management technique for process planning that defines critical and non-critical tasks with the goal of preventing time-frame problems and process bottlenecks#’ activities are "critical," meaning that they have to be done on time or else the whole project will take longer.</i>
-----	---

---

**Description**

The Critical Path Method or Critical Path Analysis, is a mathematically based algorithm for scheduling a set of project activities.  
CPM will get how long your complex project will take to complete and which activities are "critical," meaning that they have to be done on time or else the whole project will take longer.

**Usage**

```
cpm(activities.duration = c(1, 4, 5, 7, 2, 3, 1),
    activities.successors = list(c(2, 3), 4, c(4, 5), 6, 7, 7, c(0)))
```

**Arguments**

`activities.duration`  
Vector with activities duration.

`activities.successors`  
Vector with dependencies between activities.

**Value**

Returns list of EST (Early Start Time), EFT(Early Finish Time),LST(Lately Start Time), LFT (Lately Finish Time) using Forward Pass and Backward Pass

**See Also**

Other scheduling: [cpm.all.schedule](#), [mmf.all.sequences](#), [mmf.get.breakeven](#), [mmf.get.selffunding](#), [mmf.npv](#)

**Examples**

```
ex.cpm.activities.duration <- c(1,4,5,7,2,3,1)
ex.cpm.activities.successors <- list(c(2,3), 4, c(4,5), 6, 7, 7, c(0))
ex.cpm <- cpm(ex.cpm.activities.duration,
               ex.cpm.activities.successors)
```

---

cpm.all.schedule	<i>Generates all possible schedules for a cpm network</i>
------------------	---

---

**Description**

Generates all possible schedules for a cpm network

**Usage**

```
cpm.all.schedule(est, slack)
```

**Arguments**

`est`                      early start time vector

`slack`                   activities slack

**Value**

Matrix with all minimum makespan (the time to complete all jobs) cpm start time schedules

**See Also**

Other scheduling: [cpm](#), [mmf.all.sequences](#), [mmf.get.breakeven](#), [mmf.get.selffunding](#), [mmf.npv](#)

## Examples

```
#Use critical.path.method function to calculate a set of project
#activities:

ex.cpm.activities.duration <- c(1,4,5,7,2,3,1)
ex.cpm.activities.successors <- list(c(2,3), 4, c(4,5), 6, 7, 7, c(0))
ex.cpm <- cpm(ex.cpm.activities.duration,
              ex.cpm.activities.successors)

# Now, we have the CPM vector with:
# - est (Early Start Time) - ex.cpm[[1]]
# - eft (Early Finish Time) - ex.cpm[[2]]
# - lst (Late Start Time) - ex.cpm[[3]]
# - lft (Late Finish Time) - ex.cpm[[4]]

ex.cpm.activities.schedule <-
  cpm.all.schedule(ex.cpm[['est']], ex.cpm[['lst']] - ex.cpm[['est']])

# note: ex.cpm[['lst']] - ex.cpm[['est']] is the slack time (or 'float') for each task
```

---

discount.rate.vector    *Vectorize the Discount Rate*

---

## Description

Generate a vector with discount rate to be applied to each of the time periods.

## Usage

```
discount.rate.vector(interest.rate, number.of.periods,
  begin.of.period = FALSE)
```

## Arguments

**interest.rate**    A number that represents the nominal Interest Rate, presented by year.

**number.of.periods**  
                     Times that interest rate should be applied.

**begin.of.period**  
                     A boolean that represents if the Tax Rate will be applied at the beginning of period. FALSE by default, represents that Tax Rate will be applied at second period .

## Value

vector with discount rates

## See Also

Other financial: [discounted.csf](#), [draw.cfs](#), [ifir](#), [net.future.value](#), [net.present.value](#)

## Examples

```
ex.disc.vector <- discount.rate.vector(0.0619, 12)
```

---

discounted.csf	<i>The cash flows incomes/outcomes applying the Tax Rate to the present time.</i>
----------------	---

---

## Description

The cash flows incomes/outcomes applying the Tax Rate to the present time.

## Usage

```
discounted.csf(cfs = c(-350, 100, 200, 150, 75), interest.rate = 0.0619,  
  begin.of.period = FALSE)
```

## Arguments

cfs	A vector with a series of cash flows.
interest.rate	A number that represents the nominal Interest Rate, presented by year.
begin.of.period	A boolean that represents if the Tax Rate will be applied at the beginning of period. FALSE by default, the Tax Rate will be applied to the second period.

## Value

The vector of cash flows incomes/outcomes applying the Tax Rate to the present time.

## See Also

Other financial: [discount.rate.vector](#), [draw.cfs](#), [ifir](#), [net.future.value](#), [net.present.value](#)

## Examples

```
ex.disc.csf <- discounted.csf(c(-350,100,200,150,75), 0.0619, FALSE)
```

draw.cfs

*Draw the graph of cash flow***Description**

Draw the graph of cash flow in order to facilitate the study and the effects of the analysis of a certain application.

Cash flow is a mathematical concept that can be plotted in order to facilitate the study and the effects of the analysis of a certain

application, which may be an investment loan, finance, etc.

Normally a cash flow contains inputs and outputs of capital, marked in the timeline starting at  $t = 0$ .

A typical example is the graph that represents a bank loan held by a form of business that shall return this loan in  $n$  equal installments over the following months.

E1 E2 E3 ... En-1 En

^

I

0 1 2 3 ... n-1 n

III

V V V

S1 S2 S3 ... Sn-1 Sn

Is possible to note that the value is entered in the company's cash (cash was positive) and  $S_1, S_2, \dots, S_n$  are the values of the parcels will leave the company's cash (negative).

The fact that each arrow is pointing upward (positive) or down (negative), it is assumed by convention, and the cash flow will depend on who receives or pays the Capital at a certain time, and:

$t = 0$  indicates the current day;

$E_k$  is the capital input at a time  $k$ ;

$S_k$  is the capital output at a time  $k$ .

**Usage**

```
draw.cfs(cfs, gt = "Cash Flow Graphic", to.file = FALSE,
         filename = "output/draw.cfs.graph.png")
```

**Arguments**

cfs	A vector with a series of cash flows.
gt	A title for the graph.
to.file	Save or not the graph in the file
filename	File's name

**Value**

A plot with cash flow series

**See Also**

Other financial: [discount.rate.vector](#), [discounted.csf](#), [ifir](#), [net.future.value](#), [net.present.value](#)

**Examples**

```
ex.cfs <- c(-2000,1000,1500,-500,500)
draw.cfs(ex.cfs, 'My Cash Flow')
```

---

draw.graph

*Draw the graph imported from the spreadsheet.*

---

**Description**

This function is responsible for plotting the graph based on the edges and export the image to a file.

**Arguments**

edges - A vector defining the edges, the first edge points from the first element to the second, the second edge from the third to the fourth, etc.

**Value**

graph.image.path - The path to the generated graph file.

**Examples**

```
ex.graph.image.path <- draw.graph(c(1,2, 1,3, 2,3, 3,4))
```

---

excel.list.to.xls

*Export the generated ifm package results to a spreadsheet.*

---

**Description**

This function is responsible for reading a list of objects and export a spreadsheet with the results proccessed by the IFM package. The file contains:

- The raw data frame used to calculate the maxNPV, minSF and minBKE;
- The image oh the generated graph;
- The image oh the "Discounted Cash x Time" chart;
- The image oh the "MPV (ca\$h) x Schedulling ID" chart;
- The image oh the "Self Funding (time) x Schedulling ID" chart;
- The image oh the "Breaking Event (time) x Schedulling ID" chart;

**Arguments**

`list.ifm.result`

The list with all results processed by the IFM package.

**Value**

`file.path` The path to the generated file.

**See Also**

Other utility: [excel.xls.to.list](#)

**Examples**

```
ex.sheet.data <- excel.xls.to.list("../resources/spreadsheet.xls")
ex.sheet.data.interest.rate <- ex.sheet.data[[1]]
ex.sheet.data.activities <- ex.sheet.data[[2]]
ex.sheet.data.durations <- ex.sheet.data[[3]]
ex.sheet.data.predecessors <- ex.sheet.data[[4]]
ex.sheet.data.cfs <- ex.sheet.data[[5]]

ex.mmf.seq <- mmf.all.sequences(ex.sheet.data.predecessors)

ex.mmf <- mmf.npv(ex.sheet.data.cfs,
                 ex.sheet.data.durations,
                 ex.mmf.seq,
                 ex.sheet.data.interest.rate)

ex.mmf.schedules <- ex.mmf[['schedules']]
ex.mmf.cfs.nominal <- ex.mmf[['cfs.nominal']]
ex.mmf.cfs.discounted <- ex.mmf[['cfs.discounted']]
ex.mmf.npv <- ex.mmf[['npv']]

ex.mmf.npv.selffunding <- mmf.get.selffunding(ex.mmf.cfs.discounted)
ex.mmf.npv.breakeven <- mmf.get.breakeven(ex.mmf.cfs.discounted)

ex.mmf.df.1r <- mmf.df.1r(ex.mmf.seq,
                         ex.mmf.schedules,
                         ex.mmf.npv,
                         ex.mmf.npv.selffunding,
                         ex.mmf.npv.breakeven)

ex.file.path <- excel.list.to.xls(ex.mmf.df.1r)
```

---

`excel.xls.to.list`

*Extract a list of variables from the spreadsheet to be used on the maxNPV function.*

---

**Description**

This function is responsible for reading a spreadsheet representing the project, and return a list with the following information (in this order): The interest rate, the list of activities, the list of durations of activities, the list of predecessors of activities and the matrix that represents the cash flow series

**Arguments**

`xls.spreadsheet.path`

The complete path to the spreadsheet that represents the project.

**Value**

List of variables to be used on the maxNPV function.

**See Also**

Other utility: [excel.list.to.xls](#)

**Examples**

```
ex.sheet.data <- excel.xls.to.list("../resources/spreadsheet.xls")
```

---

`ifir`

*Calculate the Inflation-free Interest Rate.*

---

**Description**

Calculate the Inflation-free Interest Rate.

**Usage**

```
ifir(interest.rate = 0.1425, inflation.rate = 0.0759)
```

**Arguments**

`interest.rate` A number that represents the nominal Interest Rate, presented by year.

`inflation.rate` A number that represents the Inflation Rate, presented by year.

**Value**

Returns the inflation-free interest rate

**See Also**

Other financial: [discount.rate.vector](#), [discounted.csf](#), [draw.cfs](#), [net.future.value](#), [net.present.value](#)

**Examples**

```
ex.ifir <- inflation.free.interest.rate(0.1425, 0.0759)
```

---

mmf.all.sequences	<i>Generates the topsorts list</i>
-------------------	------------------------------------

---

### Description

Generates the list of all possible MMF sequences (topsorts), constrained by the predecessors.

### Usage

```
mmf.all.sequences(predecessors = 0)
```

### Arguments

predecessors      List of Predecessors - Zero for none. The index of the list of predecessors represents the id of MMF and the value.

### Value

List of all possible MMF sequences.

### See Also

Other scheduling: [cpm.all.schedule](#), [cpm](#), [mmf.get.breakeven](#), [mmf.get.selffunding](#), [mmf.npv](#)

### Examples

```
ex.activities.predecessors<-list(0,1,2,3,1,5,c(4,6))
ex.mmf.seq <- mmf.all.sequences(ex.activities.predecessors)
```

---

mmf.df.1r	<i>Generates a data frame with Sequence, Schedule, NPV, Breakeven and Self Funding</i>
-----------	--

---

### Description

Generates a data frame with Sequence, Schedule, NPV, Breakeven and Self Funding

### Usage

```
mmf.df.1r(mmf.seq, mmf.sched, mmf.npv, mmf.npv.selffunding, mmf.npv.breakeven)
```

### Arguments

mmf.seq	A list of sequences
mmf.sched	A list of schedules
mmf.npv	A list of NPV values
mmf.npv.selffunding	A list of Selffunding times
mmf.npv.breakeven	A list of Breakeven times

## Examples

```
ex.sheet.data <- excel.xls.to.list("resources/spreadsheet.xls")
ex.sheet.data.interest.rate <- ex.sheet.data[[1]]
ex.sheet.data.activities <- ex.sheet.data[[2]]
ex.sheet.data.durations <- ex.sheet.data[[3]]
ex.sheet.data.predecessors <- ex.sheet.data[[4]]
ex.sheet.data.cfs <- ex.sheet.data[[5]]

ex.mmf.seq <- mmf.all.sequences(ex.sheet.data.predecessors)

ex.mmf <- mmf.npv(ex.sheet.data.cfs,
                 ex.sheet.data.durations,
                 ex.mmf.seq,
                 ex.sheet.data.interest.rate)

ex.mmf.schedules <- ex.mmf[['schedules']]
ex.mmf.cfs.nominal <- ex.mmf[['cfs.nominal']]
ex.mmf.cfs.discounted <- ex.mmf[['cfs.discounted']]
ex.mmf.npv <- ex.mmf[['npv']]

ex.mmf.npv.selffunding <- mmf.get.selffunding(ex.mmf.cfs.discounted)
ex.mmf.npv.breakeven <- mmf.get.breakeven(ex.mmf.cfs.discounted)

ex.mmf.df.1r <- mmf.df.1r(ex.mmf.seq,
                         ex.mmf.schedules,
                         ex.mmf.npv,
                         ex.mmf.npv.selffunding,
                         ex.mmf.npv.breakeven)
```

---

mmf.get.breakeven	<i>Get a list with all Breakeven points from CFS</i>
-------------------	--

---

## Description

Get a list with all Breakeven points from CFS

## Usage

```
mmf.get.breakeven(mmf.cfs)
```

## Arguments

mmf.cfs	A list with a vector with a series of cash flows for each MMF sechedule.
---------	--

## Value

A list with all Breakeven points for each MMF

## See Also

Other scheduling: [cpm.all.schedule](#), [cpm](#), [mmf.all.sequences](#), [mmf.get.selffunding](#), [mmf.npv](#)

**Examples**

```

ex.sheet.data <- excel.xls.to.list("resources/spreadsheet.xls")
ex.sheet.data.interest.rate <- ex.sheet.data[[1]]
ex.sheet.data.activities <- ex.sheet.data[[2]]
ex.sheet.data.durations <- ex.sheet.data[[3]]
ex.sheet.data.predecessors <- ex.sheet.data[[4]]
ex.sheet.data.cfs <- ex.sheet.data[[5]]

ex.mmf.seq <- mmf.all.sequences(ex.sheet.data.predecessors)

ex.mmf <- mmf.npv(ex.sheet.data.cfs,
                 ex.sheet.data.durations,
                 ex.mmf.seq,
                 ex.sheet.data.interest.rate)

ex.mmf.npv.selffunding <- mmf.get.breakeven(ex.mmf[['cfs.discounted']])

```

---

`mmf.get.selffunding`     *Get a list with all Selffunding points from CFS*

---

**Description**

Get a list with all Selffunding points from CFS

**Usage**

```
mmf.get.selffunding(mmf.cfs)
```

**Arguments**

`mmf.cfs`                      A list with a vector with a series of cash flows for each MMF sechedule.

**Value**

A list with all Selffunding points for each MMF

**See Also**

Other scheduling: [cpm.all.schedule](#), [cpm](#), [mmf.all.sequences](#), [mmf.get.breakeven](#), [mmf.npv](#)

**Examples**

```

ex.sheet.data <- excel.xls.to.list("resources/spreadsheet.xls")
ex.sheet.data.interest.rate <- ex.sheet.data[[1]]
ex.sheet.data.activities <- ex.sheet.data[[2]]
ex.sheet.data.durations <- ex.sheet.data[[3]]
ex.sheet.data.predecessors <- ex.sheet.data[[4]]
ex.sheet.data.cfs <- ex.sheet.data[[5]]

ex.mmf.seq <- mmf.all.sequences(ex.sheet.data.predecessors)

```

```

ex.mmf <- mmf.npv(ex.sheet.data.cfs,
                  ex.sheet.data.durations,
                  ex.mmf.seq,
                  ex.sheet.data.interest.rate)

ex.mmf.npv.selffunding <- mmf.get.selffunding(ex.mmf[['cfs.discounted']])

```

mmf.max.npv

*Return Max NPV***Description**

this function identifies the sequence of activities and respectivities schedules where with the optimized NPV

**Usage**

```
mmf.max.npv(mmf.npv, mmf.seq, mmf.schedules)
```

**Arguments**

mmf.npv	Vector of Net Present Value
mmf.seq	Vector with the sequence of activities
mmf.schedules	Vector with the collection of possible schedules

**Value**

list with NPV, sequence and schedule of the sequence with the maximum NPV

**Examples**

```

ex.sheet.data <- excel.xls.to.list("resources/spreadsheet.xls")
ex.sheet.data.interest.rate <- ex.sheet.data[[1]]
ex.sheet.data.activities <- ex.sheet.data[[2]]
ex.sheet.data.durations <- ex.sheet.data[[3]]
ex.sheet.data.predecessors <- ex.sheet.data[[4]]
ex.sheet.data.cfs <- ex.sheet.data[[5]]

ex.mmf.seq <- mmf.all.sequences(ex.sheet.data.predecessors)

ex.mmf <- mmf.npv(ex.sheet.data.cfs,
                  ex.sheet.data.durations,
                  ex.mmf.seq,
                  ex.sheet.data.interest.rate)

ex.mmf.shedules <- ex.mmf[['shedules']]
ex.mmf.cfs.nominal <- ex.mmf[['cfs.nominal']]
ex.mmf.cfs.discounted <- ex.mmf[['cfs.discounted']]
ex.mmf.npv <- ex.mmf[['npv']]

```

mmf.npv

*Calculates NPV for all schedules***Description**

Calculates NPV for all schedules

**Usage**

```
mmf.npv(cfs, durations, all.sequences, interest.rate, begin.of.period = FALSE)
```

**Arguments**

cfs	A vector with a series of cash flows.
durations	A vector with a list of activities durations.
all.sequences	List of all possible MMF sequences.
interest.rate	A number that represents the nominal Interest Rate, presented by year.
begin.of.period	A boolean that represents if the Tax Rate will be applied at the beginning of period. FALSE by default, represents that Tax Rate will be applied at second period .

**Value**

A list with all shedules, all npv csf and sum of each npv.

**See Also**

Other scheduling: [cpm.all.schedule](#), [cpm](#), [mmf.all.sequences](#), [mmf.get.breakeven](#), [mmf.get.selffunding](#)

**Examples**

```
# Loading data from XLS
ex.sheet.data <- excel.xls.to.list("../resources/spreadsheet.xls")
ex.sheet.data.interest.rate <- ex.sheet.data[[1]]
ex.sheet.data.activities <- ex.sheet.data[[2]]
ex.sheet.data.durations <- ex.sheet.data[[3]]
ex.sheet.data.predecessors <- ex.sheet.data[[4]]
ex.sheet.data.cfs <- ex.sheet.data[[5]]

# Generating all possible implementation sequences
ex.mmf.seq <- mmf.all.sequences(ex.sheet.data.predecessors)

# Calculating NVP to all possible sequences
ex.mmf.npv <- mmf.max.npv(ex.sheet.data.cfs,
                        ex.sheet.data.durations,
                        ex.mmf.seq,
                        ex.sheet.data.interest.rate)

# Selecting sequence ID which max NPV
ex.mmf.npv.max <- which.max(ex.mmf.npv[[3]])
```

```

ex.mmf.sched <- ex.mmf.npv[[1]]
ex.mmf.npv <- ex.mmf.npv[[2]]
ex.mmf.npv.sum <- ex.mmf.npv[[3]]

# Index of sequence with max NPV
# ex.mmf.npv.max <- which.max(ex.mmf.npv.sum)

# Value of max NPV
ex.mmf.npv.max.value <- ex.mmf.npv.sum[[ex.mmf.npv.max]]

# Sequence with best NPV
ex.mmf.npv.max.sequence <- ex.mmf.seq[ex.mmf.npv.max]

# Schedule of sequence with best NPV
ex.mmf.npv.max.sched <- ex.mmf.sched[ex.mmf.npv.max]

```

---

net.future.value	<i>Net Future Value is a combination of different future values from different times, all which are put into one larger present value.</i>
------------------	--

---

## Description

Net Future Value is a combination of different future values from different times, all which are put into one larger present value.

## Usage

```
net.future.value(cfs = c(-350, 100, 200, 150, 75), interest.rate = 0.0619,
  begin.of.period = TRUE)
```

## Arguments

cfs	A vector with a series of cash flows.
interest.rate	A number that represents the nominal Interest Rate, presented by year.
begin.of.period	A boolean that represents if the Tax Rate will be applied at the beginning of period. FALSE by default.

## Value

A future value of a cash flow series.

## See Also

Other financial: [discount.rate.vector](#), [discounted.csf](#), [draw.cfs](#), [ifir](#), [net.present.value](#)

## Examples

```
ex.nfv <- net.future.value(c(-350,100,200,150,75), 0.0619, TRUE)
```

---

net.present.value	<i>Difference between the present values of cash inflows and outflows</i>
-------------------	---

---

**Description**

calculates the difference between the present values of cash inflows and outflows.

**Usage**

```
net.present.value(cfs = c(-350, 100, 200, 150, 75), interest.rate = 0.0619,
  begin.of.period = TRUE)
```

**Arguments**

cfs	A vector with a series of cash flows.
interest.rate	A number that represents the nominal Interest Rate, presented by year.
begin.of.period	A boolean that represents if the Tax Rate will be applied at the beginning of period. FALSE by default, the Tax Rate will be applied to the second period.

**Value**

The sum of cash flows incomes/outcomes applying the Tax Rate to the present time

**See Also**

Other financial: [discount.rate.vector](#), [discounted.csf](#), [draw.cfs](#), [ifir](#), [net.future.value](#)

**Examples**

```
ex.npv <- net.present.value(c(-350,100,200,150,75), 0.0619, TRUE)
```

---

schedules.1r	<i>Generates all schedules for ONE resource, Denne Method.</i>
--------------	--

---

**Description**

Generates all schedules for ONE resource, Denne Method.

**Usage**

```
schedules.1r(sequences, durations)
```

**Arguments**

sequences	All sequences
durations	Duration of activities
